

My revision notebook

Keep this with your core question paper and key-term recall sheet.

Name: _____ Class: _____ Date: _____

WAGBA: choose the correct method, show clear working and explain how data is represented.

Keywords: colour depth; sampling rate; sample resolution; RLE; Huffman coding.

Types of learning - my focus

Knowledge: recall accurate meanings. Skills: calculate and decode. Understanding: explain the connection between representation and storage.

Circle: KNOWLEDGE / SKILLS / UNDERSTANDING. Which recall answer showed your next step?

Check and explain

After each round, circle the first step that caused difficulty. Tell your partner what changed and why. Keep corrections on your original question paper.

First-attempt marks	Score
Key terms	____ / 10
Image questions	____ / 4
Sound questions	____ / 5
Compression questions	____ / 7

Round 1 - prove it without notes

An uncompressed bitmap is 12 pixels wide and 10 pixels tall, with a colour depth of 4 bits. Ignore additional file information. Calculate its size in bytes. Show your working.

Round 2 - prove it without notes

Use A = 0, B = 10 and C = 11. Decode 01011. Show where each complete character code ends.

Learning pit stop: circle NEW LEARNING / CONSOLIDATING / TREADING WATER / DROWNING. Point to a step in your work that explains your choice.

Plenary: prove what you can do

FRESH CHECK | 10 marks | Work independently, without notes.

Name: _____ Class: _____

1. Image storage [3 marks]

An uncompressed bitmap is 16 pixels wide and 8 pixels tall. Its colour depth is 2 bits. Ignore additional file information. Calculate its size in bytes. Show your working.

2. Sound storage [3 marks]

A single-channel sound recording lasts 5 seconds, uses a sampling rate of 1000 Hz and a sample resolution of 8 bits. Ignore additional file information. Calculate its size in bytes. Show your working.

3. Compression saving [4 marks]

A seven-character message contains four As, two Bs and one C. A Huffman code uses A = 0, B = 10 and C = 11. Each character would use 7 bits in ASCII. Ignore storage for the code table. Calculate the compressed size, the ASCII size and the number of bits saved. Show your working.

My next revision step

Which independent answer shows what you can do now, and which step needs another attempt?

Support used for the fresh check: NONE / READING / PARTNER / TEACHER

Upload clear photographs of your written work, save your lesson PDF and submit it to Teams.
