Open the school-email login

Use your school email address. MIT has a separate account and password.

https://login.appinventor.mit.edu/login/

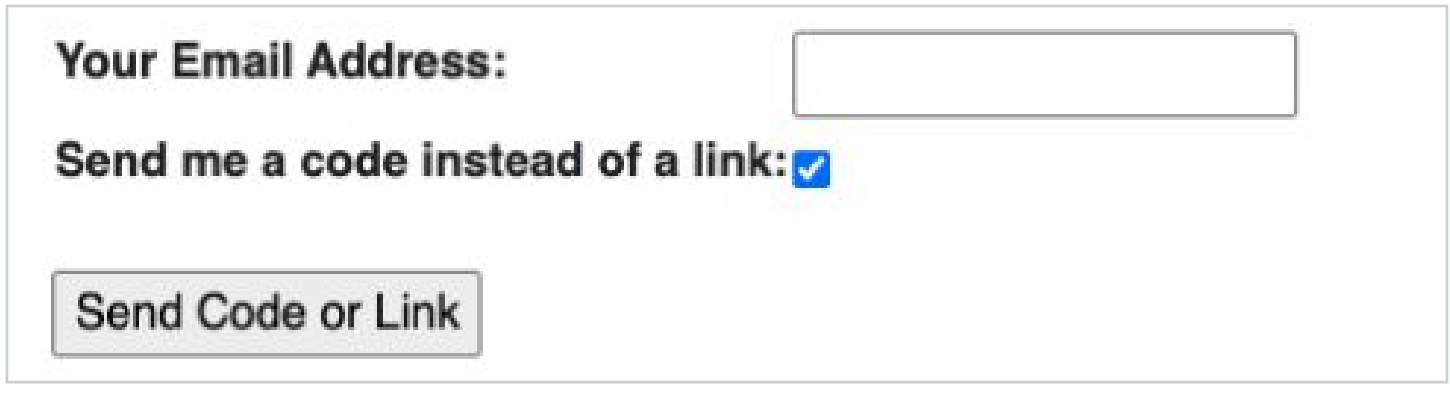

1. Open the exact link above in a new browser tab. Keep this guide open.
2. New to MIT? Select "Create an Account". Then follow Access Guide 2.
3. Already registered? Enter your school email and MIT password. Leave the site set to "MIT App Inventor Main Site" and select Login.

Use your MIT password here. Your Teams password does not become your MIT password.

Request your email code

New users only. This step starts MIT account setup; it does not finish it.

https://login.appinventor.mit.edu/cpw

1 Type your school email address into "Your Email Address". Check the spelling.

2 Keep "Send me a code instead of a link" ticked. Select "Send Code or Link" once.

3 Open your school Outlook inbox in another tab. Look for MIT's email. Keep your code private.

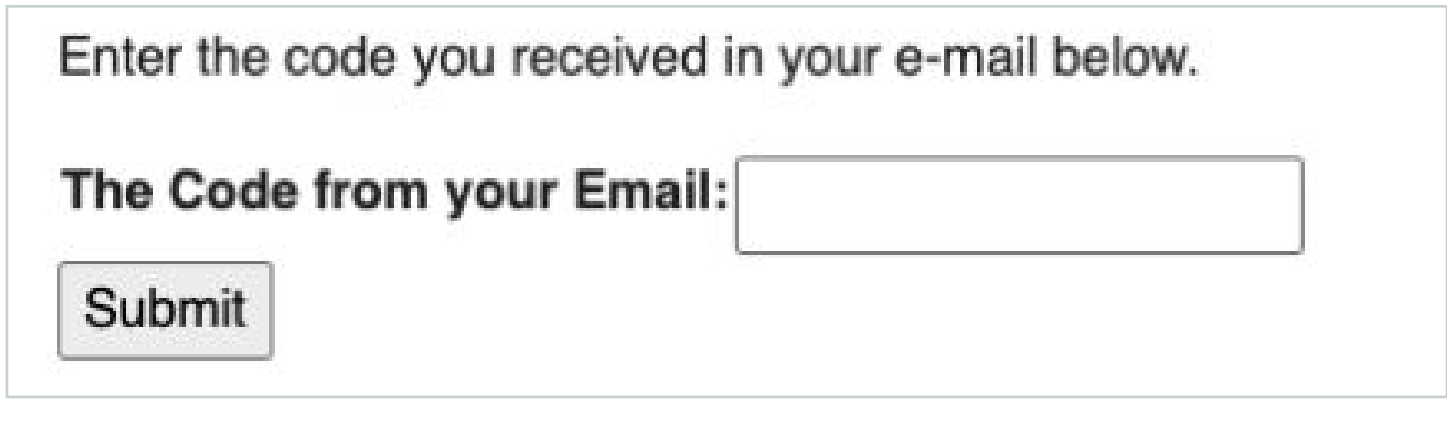

The screenshot shows the real form. The long explanation above the form has been cropped out.

No email yet? Check Junk once. If it is still missing after 3 minutes, continue the app-design activity and report "MIT email did not arrive".

Enter the code, then finish setup

Keep the MIT tab and your school inbox open while you complete this step.

https://login.appinventor.mit.edu/code

This is the real code-entry form. Password creation follows; its screen is described here, not pictured.

1. Copy the code from MIT's email into "The Code from your Email". Select Submit.
2. Follow MIT's next prompts to set a separate MIT password. Do not write it on your worksheet.
3. Keep the school-email login link for next lesson. Continue to A4 and A5 to recognise successful access.

If you are stuck, continue your app design and record which step stopped you. Do not keep requesting new codes.

Move past the welcome notice

You may see a welcome message before your project list or last project opens.

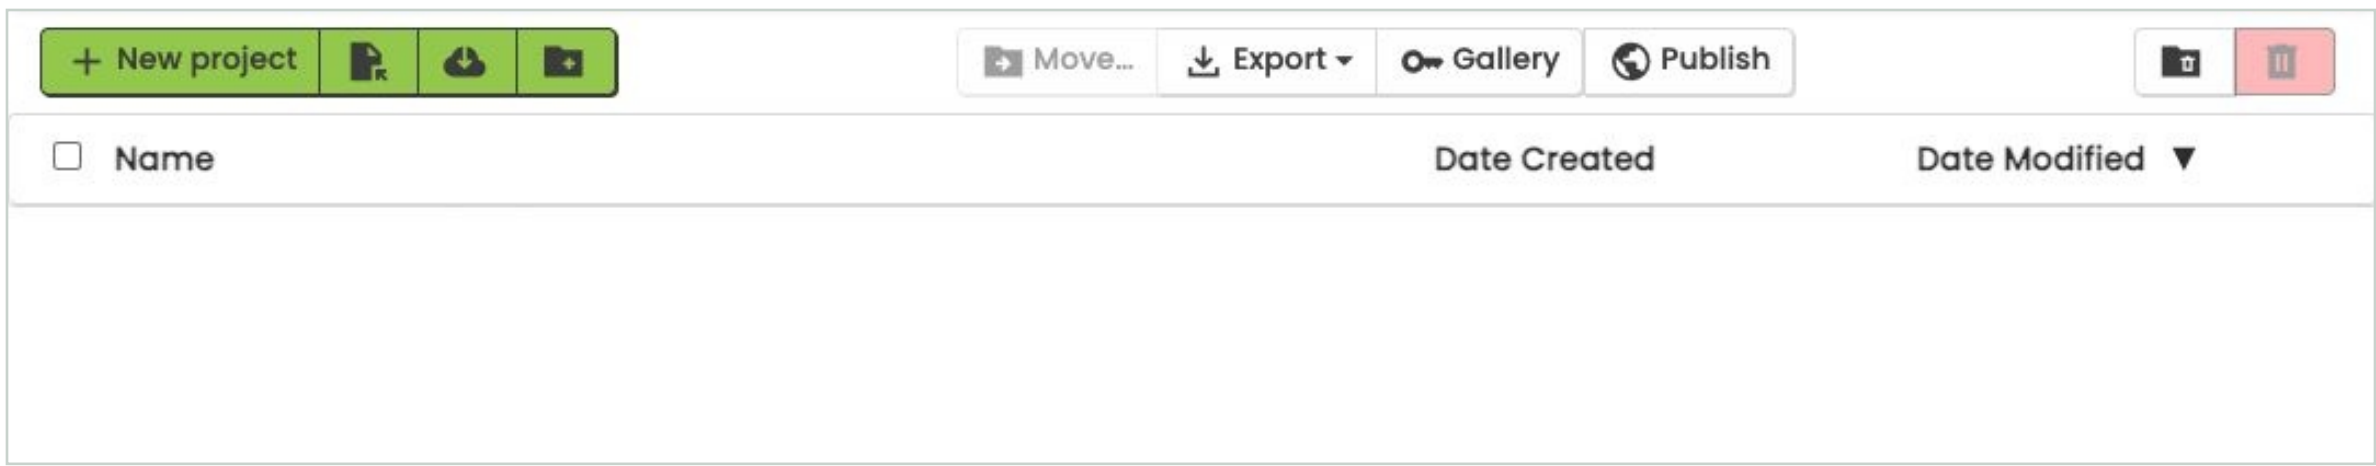

1. If you see the notice pictured, select Continue. You do not need to connect a phone today.
2. If a different window offers tutorials, select Close to continue your own app idea.
3. If no welcome window appears, go straight to A5.

The tutorial suggestions are examples from MIT. Your own app can have a different topic and purpose.

Check that your access works

This is the project list. It may be empty before you create your first project.

Check these three things

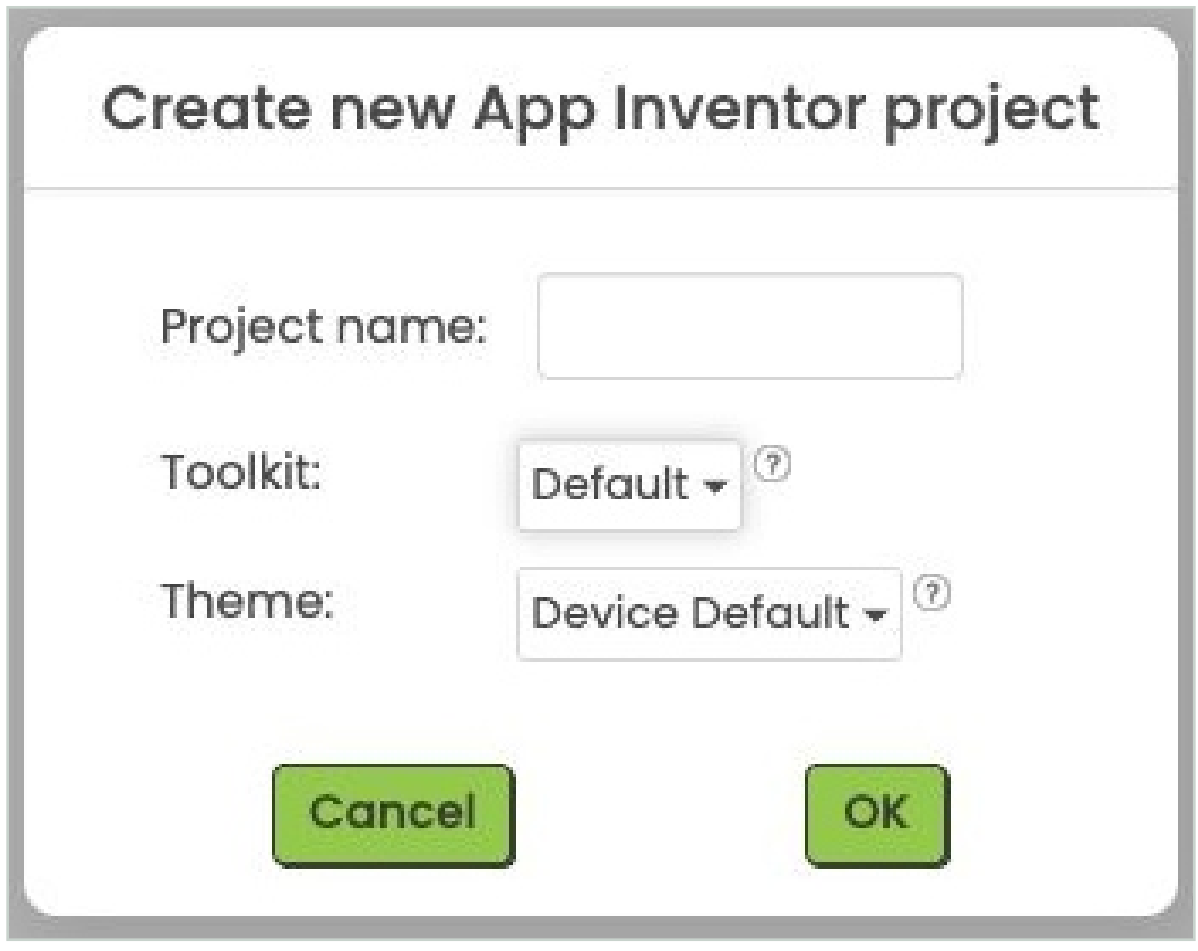

1. You can reach the project list, or an existing project opens.
2. You can return using the school-email login link and the same MIT account.
3. You know where to continue your own design activity.

Stop setup here. Continue Main Task 1. You do not need to build, publish or connect a device during this setup stage.

Returning users: if a project opens immediately, the left-arrow button beside its name returns to the project list.

Start a project for your own app

Use this reference after your design is complete, or in the next practical lesson.

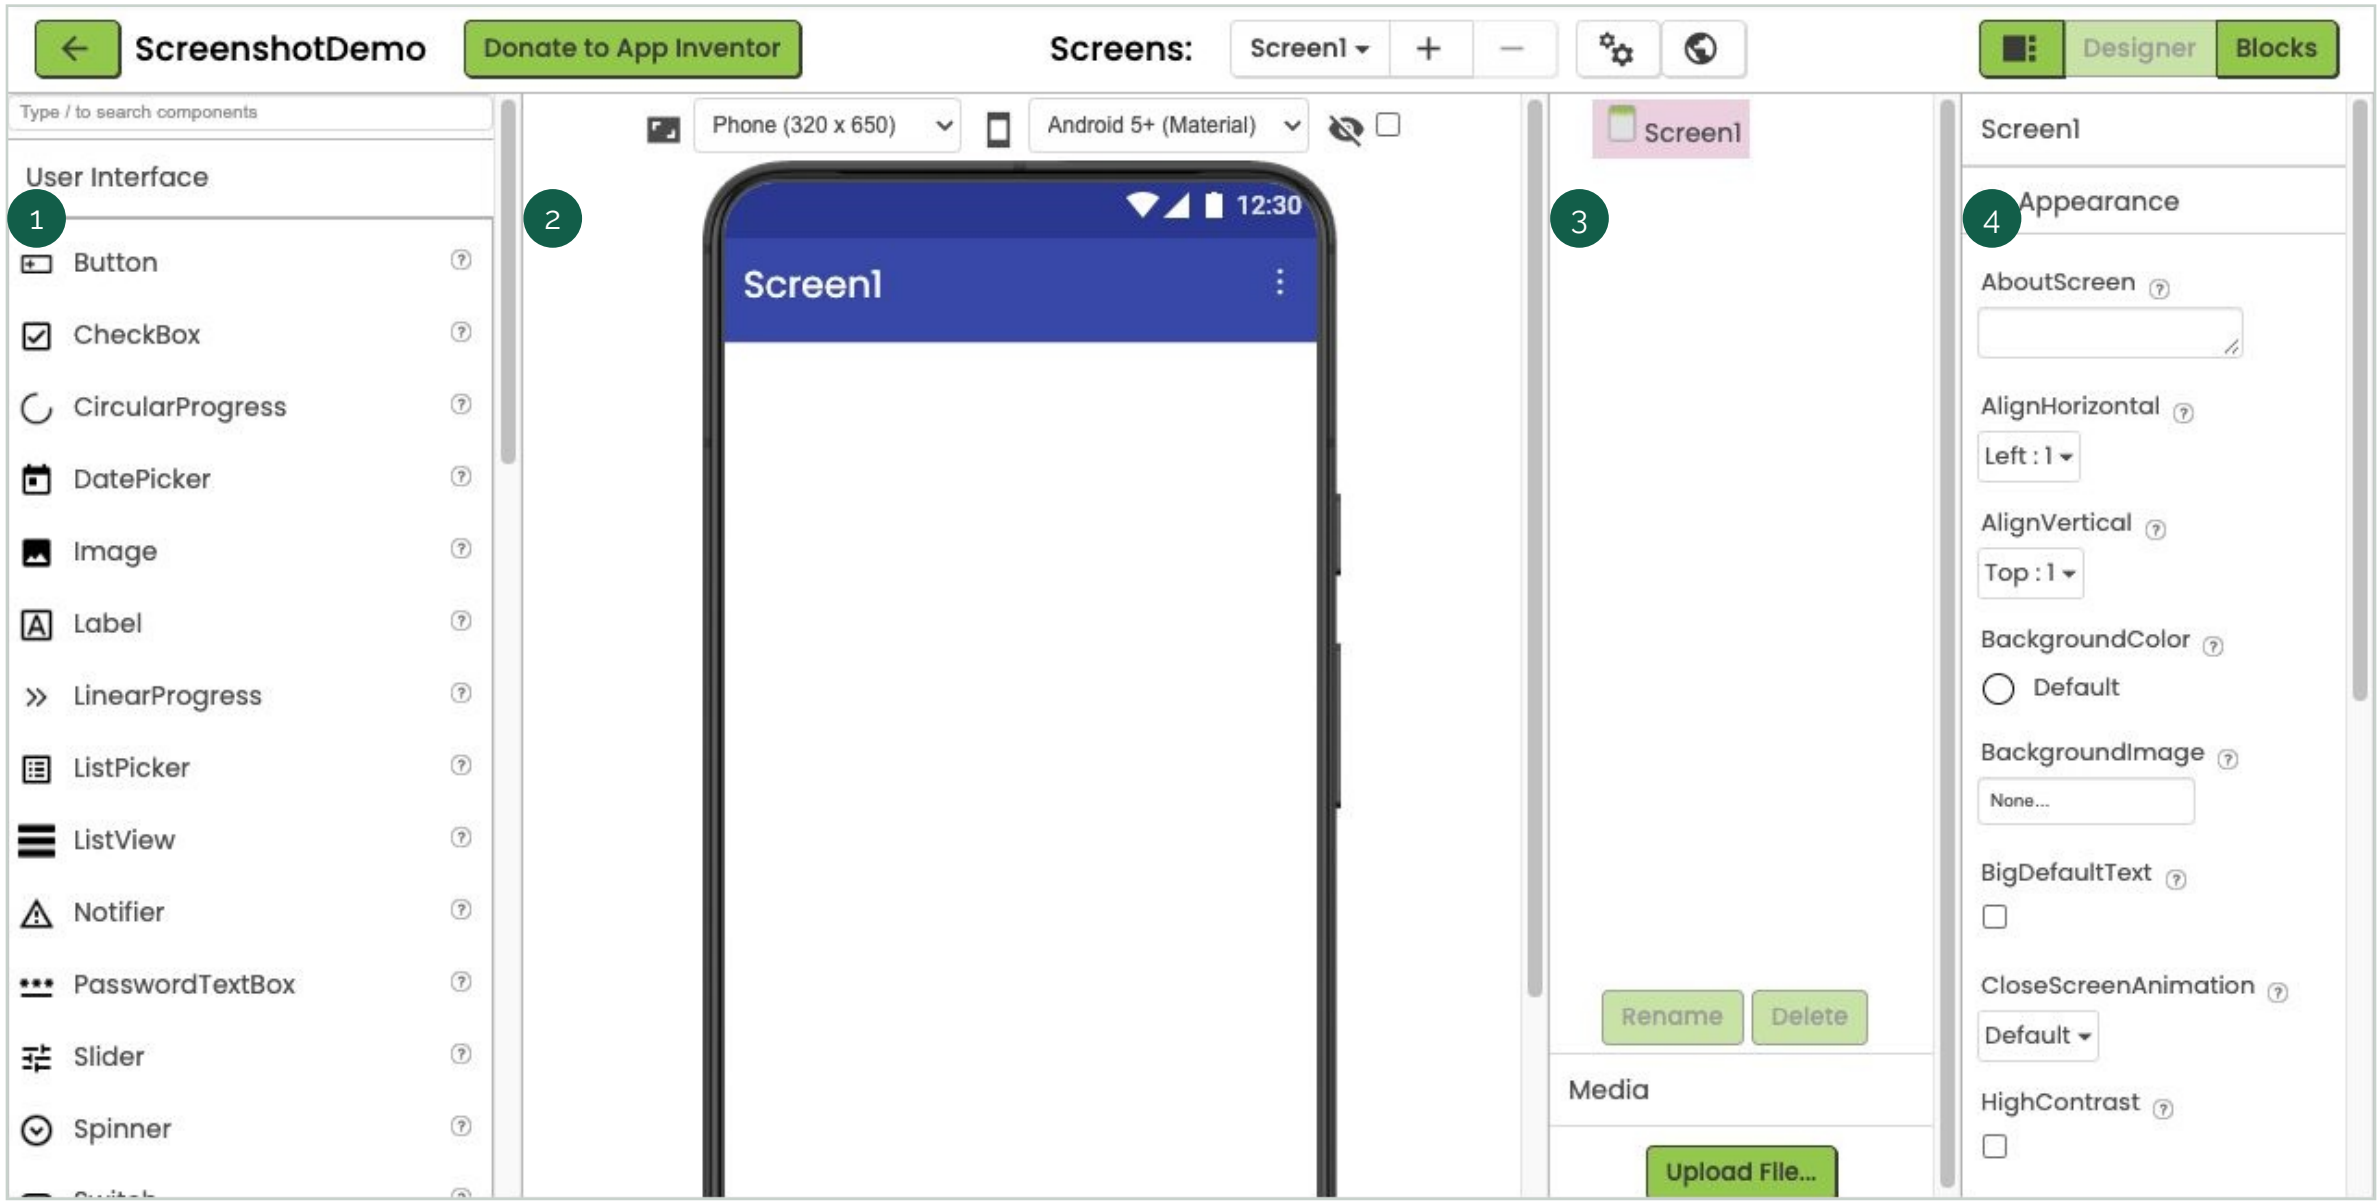

1. From the project list, select New project. This opens the form pictured.
2. Enter a short name for YOUR app, using letters. Choose a name that fits your idea.
3. Leave Toolkit and Theme as shown. Select OK. A blank Screen1 opens in Designer.

Create one project for your own idea. Keep developing that same project. The screenshot example is not a required app topic.

Find your way around Designer

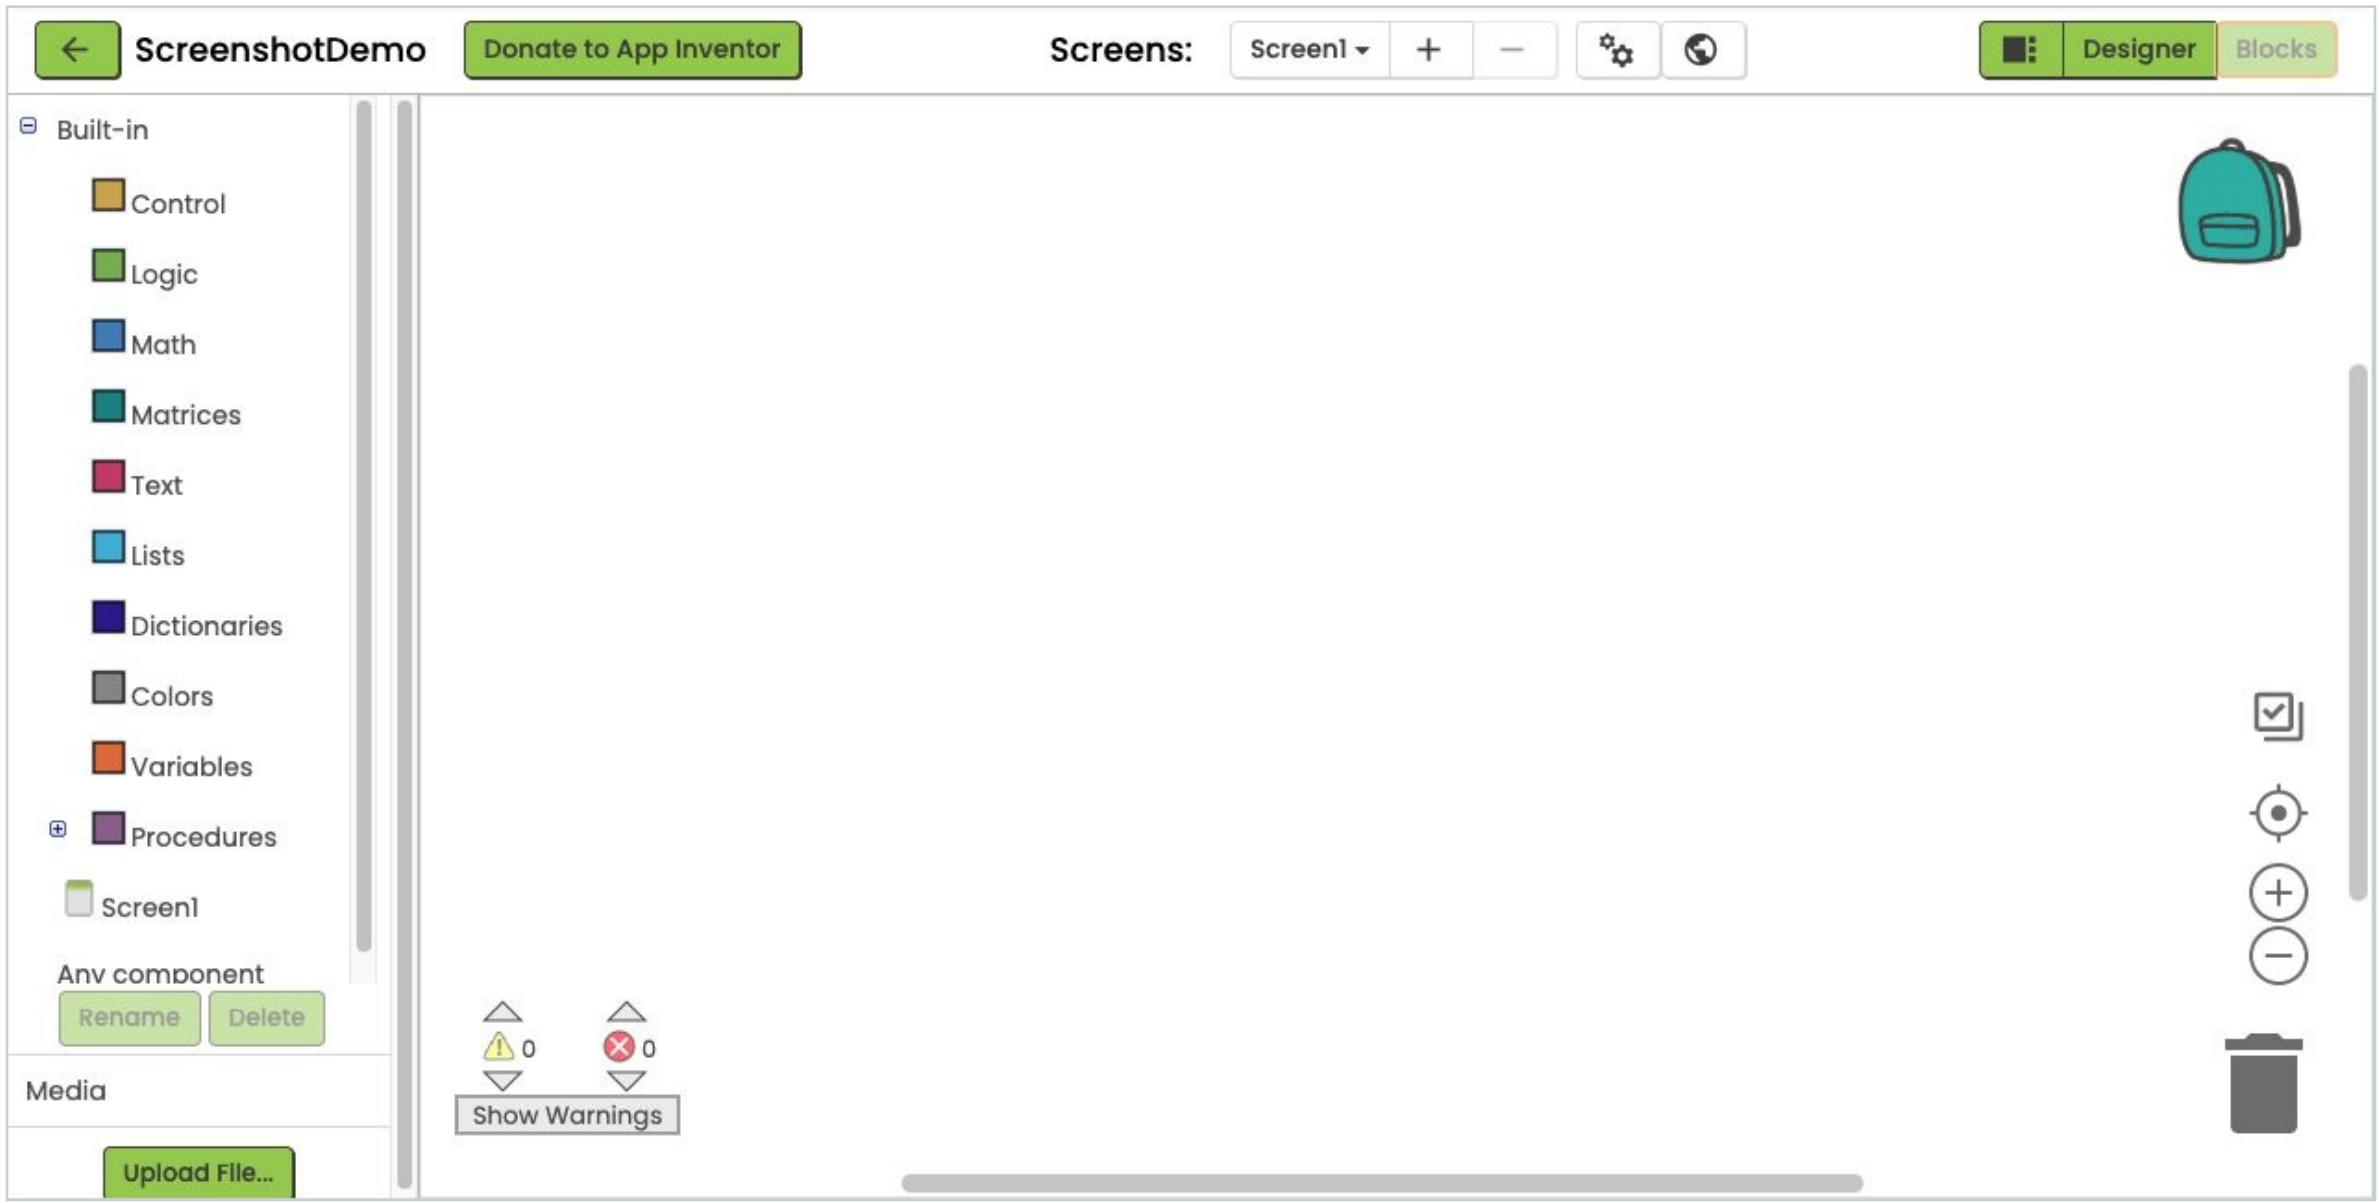

Designer arranges what the user sees and operates. The example project is blank.

1 Palette: available components. 2 Viewer: your screen preview.
3 Components: items on your screen. 4 Properties: settings for the selected item.

Recognise the Blocks workspace

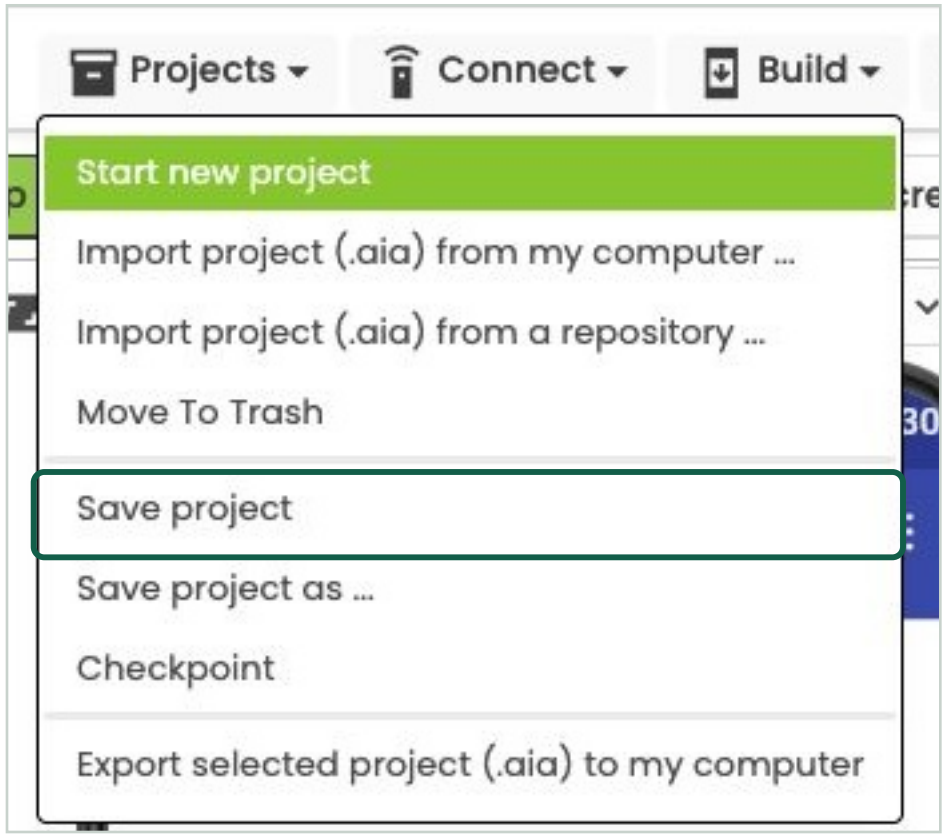

Blocks programs what happens after events. An empty workspace is normal before coding.

Use Designer and Blocks at the top right to switch views. Opening Blocks does not start a new app.
A project may reopen in its last view. Select Designer if you want to work on the screen layout.

Save and find the same project again

Use these steps once you have created your own project. No publishing is needed.

Select your project NAME in the list. The checkbox selects a row for other actions.

1. In your project, open Projects and select Save project.
2. Use the left arrow beside the project name to return to the list.
3. Select your project name to reopen it. Keep using the same MIT account.

ScreenshotDemo is the blank example used for these screenshots. Your project will have the name you choose.
