

Name: _____ Class: _____ Date: _____

Do Now and my protocol cards

Read the Do Now explanation in the app, then put it aside. The laptop connects wirelessly to the school network and opens a website.

1. Which protocol family supports the wireless connection?

2. Explain what a network protocol is.

3. Why might Wi-Fi alone not be enough? Make a prediction.

Make a card you can use again

Write a question or clear situation on the front. On the back, give the protocol, its purpose and layer. Add a follow-up question. Check the answer against the reading before you quiz a partner.

FRONT	BACK
My question or situation:	Protocol:
	Purpose:
	Layer:
	Follow-up question:

Name: _____ Class: _____ Date: _____

Check, quiz and recall

Card check: Is the purpose accurate? Is the layer correct? Is the situation clear? Ask your teacher to check any uncertainty.

Partner recall

Take turns asking and answering without looking. Use two pairs and a trio. In the trio, rotate the questioner, responder and checker. Return to a difficult card after two other questions.

Recall 1 — Protocol: _____

My first answer:

What I corrected after checking:

What I recalled when asked again:

Recall 2 — Protocol: _____

My first answer:

What I corrected after checking:

What I recalled when asked again:

Recall alone: a protocol I did not make a card for

Name the protocol. Explain its purpose and layer, then give a situation where it is useful.

Name: _____ Class: _____ Date: _____

Main Task 2 · Online exhibition

The school is hosting an online exhibition. A visitor's tablet connects through Wi-Fi to their local network and accesses the school's remote server. The registration form collects personal information. For this exercise, the website connection uses HTTPS over TCP.

A program download needs every part to arrive correctly before it can run. A separate live audio service prioritises timely conversation and can tolerate occasional missing audio.

1. Explain the four responsibilities [4]

Explain one relevant function of each layer when the visitor accesses the website.

Application [1]

Transport [1]

Network [1]

Link [1]

Pause here: show one explanation to your teacher. Which answer is about addressing? Which is about reliable delivery?

Name: _____ Class: _____ Date: _____

Choose, improve and explain

2. Explain why HTTPS is appropriate for the registration form. [2]

3a. Recommend TCP or UDP for the program download. Justify your choice. [2]

3b. Recommend TCP or UDP for the live audio service. Justify your choice. [2]

After feedback: improve one explanation.

Learning Pitstop

Circle: New learning / Consolidating / Treading water / Drowning.

Point to one answer as evidence and tell your teacher or partner what you will do next.

Plenary · no notes

The same secure website is accessed first using Wi-Fi, then Ethernet. Both connections use HTTPS over TCP. Which layer changes? Why is HTTPS still needed? How do the transport and network layers have different jobs?

Photograph all completed pages, upload them to the matching stages, then download your evidence PDF and submit it in Teams.
