

Year 10 Learning Checkpoint 1

Section D: Python practical mark scheme

Teacher copy - keep secure. This section is teacher-authored in the style of OxfordAQA practical marking. It is not an official OxfordAQA question or mark scheme.

Marking abbreviations

A. accept **R.** reject **I.** ignore **NE.** not enough **BOD.** benefit of doubt

Mark positively. Credit any logically equivalent Python 3 solution. Mark requirements independently where possible. Do not penalise the same error twice. Ignore minor differences in prompt wording and punctuation if the required result is clear.

Question	Marking guidance	Marks
04.1	Award one mark for each correct trace entry: - points = 15 - permission != "Y" is False - age >= 16 is False - age >= 14 is True - output: Aisha Intermediate 15 A. equivalent representations of Boolean values and spacing in the output. R. values obtained by changing or skipping given lines.	5 AO2=5
04.2.1	Source code: award one mark for each: - a meaningful identifier stores the name input - age input is converted to integer - permission and cancellation inputs are both stored - activity input is converted to integer - a named constant with value 5 is created - total points use activities and the named constant A. int(input(...)) or input followed by int conversion; any meaningful identifiers. R. a literal 5 used only in the calculation when no named constant is created and used.	6 AO3=6
04.2.2	Screen capture: one mark for a readable first-version run with the requested inputs, consistent with 04.2.1. Accept input prompts and typed responses. Extra printed results, including a displayed points total, are not required.	1 AO3=1
04.3.1	Completed source code: award one mark for each: - permission and cancellation are correctly compared and joined by or - rejected bookings output Booking cannot proceed - age >= 16 selects Senior - age >= 14 selects Intermediate after the Senior check - the final else selects Junior - accepted output contains name, selected group and calculated points, while rejected bookings are not assigned a group A. logically equivalent Python selection. R. use of = where comparison is required.	6 AO3=6
04.3.2	Test A capture: one mark for visible output showing Aisha, Intermediate and 15 points. It must match the completed code in 04.3.1.	1 AO3=1
04.3.3	Test B capture: one mark for visible output showing Booking cannot proceed and no age group for Zara. It must match the completed code in 04.3.1.	1 AO3=1

Question 04.2 sample first version

Correction for the issued classroom version: Question 04.2 assesses receiving, storing and processing data. It does not require an additional printed result. Award all six source-code marks where the criteria are met, including when the student has written no print statements. Do not deduct the capture mark merely because the student has not displayed their name, age or calculated points.

```
POINTS_PER_ACTIVITY = 5

name = input("Enter student name: ")
age = int(input("Enter age: "))
permission = input("Parental permission given? Y/N: ")
cancelled = input("Booking cancelled? Y/N: ")
activities = int(input("Number of activities: "))
points = activities * POINTS_PER_ACTIVITY
```

Question 04.2 screen-capture example

A capture may show the following input prompts and responses. This is an illustrative transcript, not a student screenshot. Prompt wording may vary.

```
Enter student name: Aisha
Enter age: 14
Parental permission given? Y/N: Y
Booking cancelled? Y/N: N
Number of activities: 3
```

The program can finish without printing anything else. The code calculates points = 15, which is assessed from the source listing in 04.2.1. No debugger display or extra print statement is required for 04.2.2. The capture must show this first version, rather than a different program.

Question 04.3 sample completed version

```
POINTS_PER_ACTIVITY = 5

name = input("Enter student name: ")
age = int(input("Enter age: "))
permission = input("Parental permission given? Y/N: ")
cancelled = input("Booking cancelled? Y/N: ")
activities = int(input("Number of activities: "))
points = activities * POINTS_PER_ACTIVITY

if permission != "Y" or cancelled == "Y":
    print("Booking cannot proceed")
elif age >= 16:
    print("Student:", name, "Group: Senior", "Points:", points)
elif age >= 14:
    print("Student:", name, "Group: Intermediate", "Points:", points)
else:
    print("Student:", name, "Group: Junior", "Points:", points)
```

Section D total: 20 marks - AO2=5, AO3=15

Whole assessment total: 40 marks. Sections A-C = 20; Section D = 20.

Teacher check

Award source code and screen capture marks separately. Source code is judged from the relevant printed listing; a screen capture cannot replace missing source code. A correct listing can earn its code marks even when its capture is missing. For 04.2.2, readable input prompts and responses from the first version are sufficient; do not require an additional printed result. For 04.3.2 and 04.3.3, the specified output must be visible and match the completed version. If a crop omits a required 04.3 result, its capture mark is not earned. Inspect the saved .py file only to clarify printed evidence, not to replace it.

The student is not required to submit a test table or written reflection for marks.
