Preliminary Material

Book Donation Tracker | Python 3

The school library records the number of books donated by each group. The program stores the amounts in `donations`. Each item holds one group's amount. The constant `TARGET` stores the library's donation target.

Open `Book_Donation_Tracker.py` in Python IDLE. Select **Run > Run Module**, then type menu choices in the Python Shell.

Option	What the original program does
`1`	Shows each index and the donation amount stored there.
`2`	Asks for an integer amount. A valid amount replaces the first entry; an invalid amount leaves the list unchanged.
`3`	Displays the list in its current order.
`4`	Displays the number of groups recorded.
`0`	Ends the program.

Before the test

1. Find the list, the target and the menu choice in the source code.
2. Run the program and follow the index shown beside each donation amount.
3. Use the replacement option with 11, then view the list. Try 23 and check whether the stored list changes.
4. Rerun the program and compare its starting list with the list from your previous run.

Keep the supplied file unchanged. On test day, use a fresh copy of the same program and the answer document provided.
